From smog hanging over cities to smoke inside the home, air pollution poses a major threat to health across the globe. Almost all of the global population (99%) is exposed to air pollution levels that put them at increased risk for diseases. Health consequences of short-term and long-term exposure to polluted air (outdoor or indoor) are different and clearly defined. Air pollution was the 4th leading risk factor for early death worldwide in 2021, surpassed only by high blood pressure, tobacco use, and poor diet. The Burden of Disease from air pollution, or Global Burden of Disease (GBD) is an approach to global descriptive epidemiology. GBD estimates of disease and death due to pollution are based on pollution risk factor-disease pairs for which there is currently broad scientific consensus for a causal relation between exposure and adverse health outcome(s), and for which reliable assessments of global risk can be made. WHO monitors the exposure levels and health impacts (i.e. deaths, DALYs) of air pollution at the national, regional and global level from ambient (outdoor) and household air pollution. Air quality has improved in many high-income countries over the past several decades, while dangerous levels of air pollution persist in low- and middle-income countries. It is imperative that health systems work in synergy to mitigate the impact of air pollution on people's health and quality of life. Community pharmacists are taking on an evolving role in the management of respiratory illness by providing comprehensive education and patient-centered care.

GLOBALNI PROBLEM UTICAJA ZAGAĐENJA VAZDUHA NA ZDRAVLJE LJUDI: ZNAČAJ I ULOGA FARMACEUTA

Dragana Vujanović*

Zagađenje vazduha na otvorenom ili u zatvorenim prostorima predstavlja veliku pretnju po zdravlje ljudi. Podaci ukazuju da je 99% svetske populacije izloženo povećanom zagađenju vazduha, što može dovesti do povećanog rizika od bolesti. Zdravstvene posledice pri kratkotrajnoj ili dugotrajnoj izloženosti zagađenom vazduhu su različite i jasno su definisane. Zagađenje vazduha je četvrti vodeći faktor rizika za pojavu prerane smrti u (2021 godini), a veći rizik nosi samo visok krvni pritisak, upotreba duvana i loša ishrana. Opterećenje potencijalnim bolestima koje može da izazove zagađen vazduha (engl. *Burden of diseases*, BD) ili Globalni teret od bolesti (GBD) je jedna od metoda deskriptivne epidemiologije. GBD se zasniva na proceni verovatnoće pojave bolesti ili smrti usled zagađenja, na osnovu definisanih parova – „faktor rizika od zagađenja i bolest”, za koje trenutno postoji širok naučni konsenzus o uzročno-posledičnoj vezi između izloženosti i štetnih zdravstvenih ishoda. Potrebno je da podaci omogućavaju i pouzdane procene globalnog rizika. SZO prati izloženost zagađenom vazduhu (spoljašnji i unutrašnji) i uticaje na zdravlje na nacionalnom, regionalnom i globalnom nivou. Kvalitet vazduha se poboljšao u mnogim ekonomski razvijenim zemljama u poslednjih nekoliko decenija, dok opasni nivoi zagađenja vazduha i dalje postoje u zemljama sa niskim i srednjim ekonomskim razvojem. Neophodno je da kompletan zdravstveni sistem radi sveobuhvatno kako bi ublažili uticaj zagađenja vazduha na zdravlje ljudi. Farmaceuti, koji pripadaju primarnoj zdravstvenoj zaštiti su dostupni i lako mogu da preuzmu značajnu ulogu ne samo u terapiji respiratornih bolesti, već i podizanju nivoa svesti pacijenata (sveobuhvatna edukacija i nega istovremeno) u vezi sa zagađenjem vazduha.
