EVALUATION OF THE PERFORMANCE OF TRADING COMPANIES IN SERBIA USING THE FF-WASPAS AND WASPAS METHODS

Radojko Lukić*

Faculty of Economics, University of Belgrade, Belgrade, Serbia

Abstract:

The main goal of this research paper is to comprehensively analyze the performance of trading companies in Serbia and propose appropriate measures for future improvement. In the specific case study, DELHAIZE Serbia achieved a return on sales of 2.50%, a return on assets of 3.56% and a return on capital of 6.95% in 2021. On the other hand, LIDL Serbia achieved a return on sales of 5.77%, a return on assets of 6.66% and a return on capital of 12.55% in the same year. Thus, LIDL Serbia performed more successfully than DELHAIZE Serbia. In general, foreign retail chains demonstrate better performance than domestic ones. One reason for this is that they adopt newer business methods and have a higher degree of digitization of the entire business.

INTRODUCTION

We measure and analyze the performance of trading companies in Serbia using ratio analysis, statistical analysis and the FF-WASPAS-WASPAS method. The FF-WASPAS-WASPAS method provides a more realistic assessment of the financial situation of trading companies in Serbia (Zavadskas *et al.*, 2012; Zardari *et al.*, 2014; Ersoy, 2017; Đalic *et al.*, 2020 ; Kovač *et al.*, 2021; Lalić, *et al.*, 2021; Mikšić *et al.*, 2021; Stankovič *et al.*, 2020; Saaty, 2008; Trunkg, 2021; Senapati & Yager, 2019a,b, Senapati & Yager, 2020 ; Stević & Brković, 2020; Stević *et al.*, 202; Božanic *et al.*, 2022; Pamučar *et al.*, 2021; Puška *et al.*, 2021). Based on that, the subject of research in this paper is the application of FF-WASPAS and WASPAS methods in evaluating the performance of trading companies in Serbia (Keshavarz-Ghorabaee *et al.*, 2020; Urosevic *et al.*, 2017; Saha *et al.*, 2023). The primary goal and purpose of this research are to investigate the performance of trading companies in Serbia as comprehensively as possible in order to improve them in the future by applying relevant measures.

41

The main research hypothesis in this paper is based on the fact that continuous analysis of critical performance factors of trading companies, in Serbia, using multi-criteria decision-making methods, including FF-WASPAS and WASPAS, is a basic assumption for future improvement by implementing appropriate measures. This is because several critical performance factors of trading companies are simultaneously integrated, which is not the case with classical methods.

LITERATURE REVIEW

There is an increasing body of literature dedicated to measuring and analyzing the performance of trading companies using multi-criteria decision-making methods (Ayçin et al., 2021: Popović et al., 2022; Ecer & Aycin, 2022; Mishra et al., 2022; Nguyen et al., 2022; Rani et al., 2022; Toslak et al., 2022; Shanmugasundar et al., 2022; Satici, 2022; Keshavarz-Ghorabaee et al., 2021). This is also the case with literature in Serbia (Lukic & Hadrovic, 2019, 2021, 2022; Lukic \$ Kozarevic, 2021; Lukic, 2020, 2021a,b,c,d,e, 2022a,b,c,d,e,f,g,h, 2023; Lukic et al., 2020a,b). In this work, it serves as a theoretical, methodological and empirical basis for conducting comprehensive research on performance factors of trading companies in Serbia. Through a review of the literature, it is evident that there are wide possibilities for applying multi-criteria decision-making methods in the field of trade. In his work, Ersoy (2017) theoretically analyzes the application of various methods of multi-criteria decision-making in retail, highlighting their characteristics and significance. This paper can, in our opinion, serve as a solid foundation for choosing a method that will be applied in specific retail and other trade sectors. A particular study focuses on identifying factors that influence the effectiveness of websites in retail based on the application of the Fuzzy DEMATEL method (Gaur et al., 2020). Moreover, the importance of using different methods to analyze the efficiency of electronic commerce is multiple. In the literature, extensive attention has been given to analyzing the efficiency and performance of global retail chains using the integrated fuzzy SWARA and fuzzy EATWOS methods (Görçün et al., 2022). Another separate study examined the efficiency and marketing growth of retail food companies (Harangi-Rákos & Fenyves, 2021). The subject of research in the literature is the evaluation and selection of suppliers in the context of the green economy (Keshavarz-Ghorabaee et al., 2020). Additionally, considerable emphasis has been placed on analyzing logistics efficiency using the multi-criteria decision-making method (LMAW) (Pamučar et al., 2021). Another study highlighted the importance of improving the procurement process for retail companies (Maxim, 2021), with multi-criteria decision-making methods playing a significant role in this regard. Furthermore, multi-criteria decision-making methods offer extensive possibilities for analyzing logistics efficiency. They can be utilized to assess efficiency of individual distribution channels. Similarly, by means of multi-criteria decision-making methods, the selection of employees in retail and in supplementary activities, such as for example tourism, can be carried out (Urosevic et al., 2017). Overall, there are wide possibilities of applying multi-criteria decision-making methods to enhance the performance and efficiency of trading companies. Consequently, works focusing on the analysis of financial performance and trade efficiency in Serbia have been published in Serbian literature, using various multi-criteria decision-making methods (Fuzzy AHP - TOPSIS, ELECTRE, MABAC, OCRA, WASPAS, ARAS, MARCOS, TRUST) (Lukic et al., 2020; Lukic & Hadrovic Zekovic, 2021, 2022; Lukic, 2021a,b, 2022a,b,c,d, e,f,g,h; Lukic et al., 2021), as well as DEA approaches (Lukic, 2022g). Multi-criteria decision-making methods were applied in the performance analysis of trading companies in Serbia because they provide more realistic results compared to classical methods of financial analysis (for example, ratio analysis), as they consider several criteria simultaneously. When analyzing the performance

Ĭ

of trading companies in Serbia using different methods of multi-criteria decision-making, the following criteria were most often used: number of companies, number of employees, assets, capital sales and net profit. These criteria serve as reliable measures of performance and are in line with the nature of the trade. A special study also placed significant focues on the comparative analysis of the information performance of trade between the European Union and Serbia based on the MARCOS method (Lukic, 2022h).

METHODOLOGY

The analysis of the problem in this paper focuses on the application of the FF-VASPAS (Fermatean Fuzzy VASPAS) method and WASPAS method. FF-WASPAS method is based on Fermat fuzzy sets. Fermatean fuzzy sets (Fermatean Fuzzy Sets - FFSs) are valuable tools for managing uncertain information with maximum accuracy and flexibility (Senapati & Yager, 2020; Sıcakyüz, 2023; Hezam *et al.*, 2023). It can be successfully used in the decision-making process. Three components are used in defining FFSs: the degree of membership (α), the degree of non-membership (β) and the degree of indeterminacy (π).We will discuss some features and operators associated with FFSs.

Definition 1. Let X denote the universe of discourse. The Fermatean fuzzy set can be \tilde{R} defined as follows:

$$\tilde{R} = \left\{ \left\langle x, a_{R}(x), \beta_{R} \right\rangle : x \in X \right\}$$
(1)

wherein $a_{R}(x): X \to [0,1], \beta_{R}(x): X \to [0,1]$, and $0 \le (a_{R}(x))^{3} + (\beta_{R}(x))^{3} \le 1$. In addition, the degree of uncertainty is $\pi_{R}(x) = \sqrt[3]{1 - (a_{R}(x))^{3} - (\beta_{R}(x))^{3}}$. For convenience, we use $\tilde{R} = (a_{R}, \beta_{R})$ to represent FFS (Senapati & Yager, 2019).

Definition 2. Assume that $\tilde{R} = (a_{R}, \beta_{R})$ and $\tilde{S} = (a_{s}, \beta_{s})$ are Fermatean fuzzy sets i λ positive real number ($\lambda \leq 0$). The following operators can be defined for FFSs (Senapati & Yager, 2019a).

$$\widetilde{R} \oplus \widetilde{S} = \left(\sqrt[3]{a_{\scriptscriptstyle R}^3 + \beta_{\scriptscriptstyle S}^3 - a_{\scriptscriptstyle R}^3 a_{\scriptscriptstyle S}^3, \beta_{\scriptscriptstyle R} \beta_{\scriptscriptstyle S}}\right)$$
(2)

$$\widetilde{R} \oplus \widetilde{S} = \left(a_{R}a_{s}\sqrt[3]{\beta_{R}^{3} + \beta_{s}^{3} - \beta_{R}^{3} + \beta_{s}^{3}}\right)$$
(3)

$$\lambda.\tilde{R} = \left(\sqrt[3]{1 - \left(1 - a_{R}^{3}\right)^{\lambda}, \beta_{R}^{\lambda}}\right)$$
(4)

$$\tilde{R}^{\lambda} = \left(a_{R}^{\lambda}, \sqrt[3]{1 - \left(1 - \beta_{R}^{3}\right)^{\lambda}}\right)$$
(5)

Definition 3. Let $\tilde{R} = (a_R, \beta_R)FFS$. The score *T* function and accuracy function *A* for FFS are defined as (Senapati & Yager, 2019a):

$$T = \left(\tilde{R}\right) = a_{R}^{3} - \beta_{R}^{3} \tag{6}$$

$$A = \left(\tilde{R}\right) = a_{\scriptscriptstyle R}^{\scriptscriptstyle 3} + \beta_{\scriptscriptstyle R}^{\scriptscriptstyle 3} \tag{7}$$

43

These functions are used to compare two FFSs, i.e. $\tilde{R} = (a_s, \beta_s)$ and $\tilde{S} = (a_s, \beta_s)$. They exist when different conditions are met (Senapati & Yager, 2019a):

1. If $T(\tilde{R}) < T(\tilde{S})$, then $\tilde{R} < \tilde{S}$; 2. If $T(\tilde{R}) > T(\tilde{S})$, then $\tilde{R} > \tilde{S}$; 3. If $T(\tilde{R}) = T(\tilde{S})$, then i. If $A(\tilde{R}) < A(\tilde{S})$, then $\tilde{R} < \tilde{S}$; ii. If $A(\tilde{R}) > A(\tilde{S})$, then $\tilde{R} > \tilde{S}$; iii. If $A(\tilde{R}) = A(\tilde{S})$, then $\tilde{R} = \tilde{S}$.

Definition 4. Complement FFS $\tilde{R} = (a_R, \beta_R)$ is defined as follows (Senapati & Yager, 2019a):

$$Com(\tilde{R}) = (\beta_{R}, a_{R})$$
(8)

Definition 5. Let be a $\tilde{R}_i = (a_R, \beta_R)$ (i = 1, 2, ..., n)set of n FFSs, and $w = (w_1, w_2, ..., w_n)^T$ the corresponding weight vector for the $\tilde{R}_i = \sum_i w_i = 1$. Fermatean fuzzy weighted average (FFWA) aggregate operator is defined based on the following equation (Senapati & Yager, 2019b):

$$FFWA(\tilde{R}_{1},\tilde{R}_{2},...\tilde{R}_{n}) = \left(\sum_{i=1}^{n} w_{i}a_{R_{i}},\sum_{i=1}^{n} w_{i}\beta_{R_{i}}\right)$$
(9)

Definition 6. Definition 3 defines the result of the function FFS. Let $\tilde{R} = (a_R, \beta_R)FFS$. The value of $T(\tilde{R})$ can vary in the range from -1 to 1. According to this range, the positive score FFS function is defined. It always gives a positive defuzzified value.

$$T^{P}\left(\tilde{X}_{ij}\right) = 1 + T\left(\tilde{X}_{ij}\right) \tag{10}$$

Let us denote the number of alternatives by *n*, the number of criteria by *m* and the number of decision makers by *p*. The extended VASPAS method takes place through several steps (Senapati &Yager, 2019a,b).

Step 1: Determining the group of decision makers.

In this step, experts are chosen to define the problem. They should have enough knowledge about the subject.

Step 2: Defining a set of alternatives.

A group of decision makers should evaluate the problem and list possible and important alternatives for the evaluation process.

Step 3: Defining a set of evaluation criteria.

Alternatives are evaluated according to defined criteria. Decision makers evaluate the criteria. The criteria are defined on the basis of data obtained on alternatives from existing related studies.

Step 4: Determining the weight of the criteria(*w_i*).

In this step, for example, the SMART (Simple Multi-Attribute Rating Technikue) method (Zardari *et al.*, 2014) can be used to determine the weights of the criteria. The decision maker is asked to assign 10 points to the least important criterion, and to give an increasing number of points (up to 100) for

more important criteria. The sum of points of all criteria is calculated. Criterion weights are determined by normalizing the sum of points.

Step 5: Determination of linguistic terms and corresponding Fermat fuzzy scopes.

In this step, decision makers define linguistic terms such as "very low" and "very high" and their corresponding FFS.

Step 6: Assigning scores of alternatives for each criterion by the decision maker.

In this step, the decision maker evaluates alternatives against each defined criterion. Linguistic terms defined in the previous step on the basis of Fermat's fuzzy sets are used. Evaluation of the *i*-th alternative in relation to the *j*-th criterion by the *k*-th decision-maker symbolized by

$$\tilde{E}_{_{ijk}} = \left(a_{_{E_{ijk}}}, \beta_{_{E_{ijk}}}\right).$$

Step 7: Consolidation of evaluation criteria by decision makers.

The aggregation operator is defined in equation (9). Using this equation and equal weights $\left(w_{k} = \frac{1}{p}\right)$, the evaluations of the decision makers are aggregated in step 6. The aggregated evaluations or elements of the decision matrix $\left(\tilde{X}_{ij} = \left(a_{x_{ij}}, \beta_{x_{ij}}\right)\right)$ are represented as:

$$\tilde{X}_{ij} = FFWA(\tilde{E}_{ij1}, \tilde{E}_{ij2}, ..., \tilde{E}_{ijp}) = \left(\frac{1}{p} \sum_{k=1}^{p} a_{kijk}, \frac{1}{p} \sum_{k=1}^{p} \beta_{kijk}\right)$$
(11)

Step 8: Normalization of the decision matrix.

The linear normalization method is used in the classical WASPAS method to normalize the decision matrix. However, when we use Fermat fuzzy ranges, then we encounter elements that range from 0 to 1. Therefore, the normalization method cannot be used to change the scale of values. In the case when we have cost criteria, we have to make certain modifications. In this study, the FFS supplement concept is used to transform values related to cost criteria. The complement is defined in equation (8). Let BC and NC be the benefit and non-benefit criterion sets, respectively. The elements of the normalized decision matrix can be defined as follows:

$$\tilde{N}_{ij} = \begin{cases} \tilde{X}_{ij} & \text{if } j \in BC \\ Com(\tilde{X}_{ij}) & \text{if } \in NC \end{cases}$$
(12)

Step 9: Determination of VSM and VPM measures.

Based on addition, multiplier and other FFS operators defined in the previous section (equation (2) to (5)), measures of VSM and VPM are calculated:

$$\tilde{Q}_{i}^{s} = \bigoplus_{j=1}^{m} \left(\boldsymbol{w}_{j} \oplus \tilde{N}_{ij} \right)$$
(13)

$$\widetilde{Q}_{i}^{p} = \bigoplus_{j=1}^{m} \left(\widetilde{N}_{ij}^{w_{j}} \right)$$
(14)

Step 10: Determination of the VASPAS measure.

By combining the VSM and VPM measures, the WASPAS measure is calculated. In doing so, it is necessary to define the combined parameter γ and its value. The following formula is used to calculate:

$$\tilde{Q}_{i} = \gamma \tilde{Q}_{i}^{s} \oplus (1 - \gamma) \tilde{Q}_{i}^{p}$$
(15)

Step 11: Ranking alternatives based on positive values of \tilde{Q}_i .

Definition 6 is used to compare \tilde{Q}_i values and rank alternatives.

The WASPAS method is used to solve various complex problems in multi-criteria decision-making (for example, production decision-making) (Zavadskas *et al.* 2012;Chakraborty & Zavadskas, 2014; Zavadskas *et al.*, 2013a,b). An advanced fuzzy WASPAS method was developed for solving complex problems under uncertainty.

The procedure of the WASPAS method consists of the following steps (Urosevic et al., 2017):

Step 1. Determining the optimal performance rating for each criterion.

The optimal performance rating is calculated as follows:

$$\boldsymbol{x}_{oj} = \begin{cases} \max_{i} \boldsymbol{x}_{ij}; j = \in \Omega_{\max} \\ \min_{i} \boldsymbol{x}_{ij}; j = \in \Omega_{\min} \end{cases},$$
(16)

where: x_{0j} denotes the optimal performance rating of the *i*-th criterion, Ω_{max} denotes the benefit criterion (the higher the value, the better), Ω_{min} denotes the set of cost criteria (the lower the value, the better), *m* denotes the number of alternatives (*i*= 0.1,..., *m*), and *n* denotes the number of criteria (*j*= 0,1,..., *n*).

Step 2. Determination of the normalized decision matrix.

The normalized performance rating is calculated as follows:

$$\boldsymbol{r}_{ij} = \begin{cases} \frac{\boldsymbol{x}_{ij}}{\boldsymbol{x}_{oj}}; \ j \in \Omega_{max} \\ \frac{\boldsymbol{x}_{oj}}{\boldsymbol{x}_{ij}}; \ j \in \Omega_{min} \end{cases},$$
(17)

where: r_{ij} denotes the normalized performance rating of the *i*- th alternative in relation to the *j* - th criterion.

Step 3. Calculation of the relative importance of the *i*- th alternative based on the WS method.

The relative importance of the *i*- th alternative, based on the WS method, is calculated as follows:

$$Q_{i}^{(1)} = \sum_{j=1}^{n} w_{j} r_{ij}, \qquad (18)$$

where: $Q_i^{(1)}$ indicates the relative importance of the *i*- th alternative in relation to the *j* - th criterion, based on the WS method.

Step 4. Calculation of the relative importance of the *i*- th alternative, based on the bzi WP method. The relative importance of the alternative, based on the WP method, is calculated as follows:

$$Q_{i}^{(2)} = \prod_{j=1}^{n} r_{ij}^{w_{j}},$$
(19)

where: $Q_i^{(2)}$ denotes the relative importance of the *i*- th alternative in relation to the *j* - th criterion, based on the WP method.

Step 5. Calculating the overall relative importance for each alternative.

The total relative importance (common generalized criterion of weight aggregations of additive and multiplicative methods) (Zavadskas *et al.*, 2012) is calculated as follows:

$$Q_{i} = \lambda Q_{i}^{(1)} + (1 - \lambda) Q_{i}^{(2)} = \lambda \sum_{j=1}^{n} w_{j} r_{ij} + (1 - \lambda) \prod_{j=1}^{n} r_{ij}^{w_{j}}$$
(20)

where: λ is the coefficient and $\lambda \in [0,1]$.

When decision-makers have no preference for the coefficient, the value is 0.5, and equation (5) is expressed as:

$$Q_{i} = 0.5Q_{i}^{(1)} + 0.5Q_{i}^{(2)} = 0.5\sum_{j=1}^{n} w_{j}r_{ij} + 0.5\prod_{j=1}^{n} r_{ij}^{w_{j}}$$
(21)

RESULTS AND DISCUSSION

Table 1 and Figure 1 show the criteria, alternatives and relevant initial data (Source: Agency for Economic Registers of the Republic of Serbia). Table 2 shows the descriptive statistics. (All calculations, results and the pictures are made by the authors.)

	C1 - Business income	C2 - Net result	C3 - Assets	C4 - Capital	C5 - Number of employees

Maximum	1	118913.00	4133.00	83479.00	42756.00	11637.00

Descriptive statistics show that, for example, the net result of the largest trading companies in Serbia ranged from -1629.00 (MERCATOR-S) to 4133.00 (LIDL Serbia). The situation is the same with respect to the range and with other statistical variables (business income from 37563.00 (LUKOIL SERBIA) to 118913.00 (DELHAIZE SERBIA), business assets from 8969.00 (LUKOIL SERBIA) to 83479.00 (DELHAIZE SERBIA), capital from .00 (MERCATOR-S) to 42756.00 (DELHAIZE SERBIA) and Number of employees from 47.00 (OMV SERBIA) to 11637.00 (DELHAIZE SERBIA). According to the descriptive statistics of the analyzed indicators, the company achieves the best performance DELHAIZE SERBIA. Table 3 shows the correlation matrix of the initial data.

LIDL SERBIA	5.77%	1.154155	1.884571	6.66%	12.55%	1408.177
MOL SERBIA	1.99%	3.005996	1.581671	5.99%	9.47%	11816.33
LUKOIL SERBIA	4.79%	4.188092	1.859631	20.06%	37.30%	12155.41

Figure 2. Profit from the sale of trading companies in Serbia

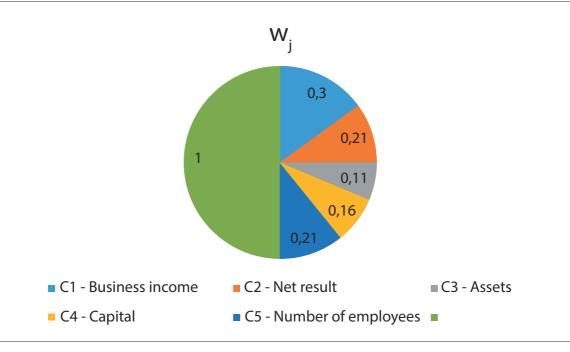

In the specific case, the trading company DELHAIZE Serbia in 2021 achieved a return on sales on 2.50%, a return on assets of 3.56% and a return on capital of 6.95%. In the same year, the trading company LIDL Serbia achieved a return on sales of 5.77%, a return on assets of 6.66% and a return on capital of 12.55%. So, trading company LIDL Serbia performed more successfully than trading company DELHAIZE Serbia. Generally speaking, foreign retail chains achieve better performance than domestic ones. One of the reasons for this is that they apply newer business methods and a greater degree of digitization of the entire business. Table 5 and Figure 3 show weight coefficients of criteria.

Kind	Criteria	DM1	DM2	DM3	SUM	Wj
1	C1 - Business income	100	100	100	300	0.30

Table 5. Weight coefficients of the criteria

Figure 3. Weight coefficients of criteria

The most important criterion in this case is C1. Next: C2, C5, C4 and C3. The calculation and results of the FF-WASPAS method are shown in Tables 6 – 12 and Figure 4.

Figure 5. Ranking of trading companies according to the WASPAS method

Significant trading companies in Serbia include: DELHAIZE SERBIA, LIDL SERBIA, MERCATOR-S, NELT CO. and MOL SERBIA. KNEZ PETROL ranked the lowest among them. The performance of trading companies in Serbia is influenced by various factors, such as the global political and economic climate, interest rate, inflation, employment, exchange rate, living standards of the population, multi-channel sales – both in-store and electronic, sale of organic products, private brands, implementation of new concepts of cost, sales and profit management, customer management strategies, product categories, sustainable development, application of Japanese business philosophy, energy crisis, transportation and logistics costs and digitization of business processes.

The utilization of multi-criteria decision-making methods (Fuzzy AHP - TOPSIS, ELECTRE, MABAC, OCRA, ARAS, MARCOS, TRUST, FF-WEASPAS, WASPAS, etc.), as well as financial and statistical data, provides a more realistic overview of the financial situation of trading companies in Serbia. Therefore, these methods are highly recommended. It is also suggested to carry out similar research in other countries, as it allows for international comparisons to be made.

CONCLUSION

In trading companies in Serbia, there is a significant correlation between the net result and the number of employees.Specifically, there is a strong correlation between the number of employees and business income and business assets at the level of statistical significance. Additionally, there is a significant correlation between capital and business income, net result and business assets. Furthermore, there is a significant correlation between the net result and the number of employees. Labor productivity is a significant factor in the performance of trading companies in Serbia. In the specific case of DELHAIZE Serbia in 2021, they achieved a return on sales of 2.50%, a return on assets of 3.56% and a return on capital of 6.95%. On the other hand, the trading company LIDL Serbia achieved a return on sales of 5.77%, a return on assets of 6.66% and a return on capital of 12.55% in the same year. Therefore, LIDL Serbia outperformed DELHAIZE Serbia. Generally speaking, foreign retail chains achieve better performance than domestic ones. One of the reasons for this is that they adopt newer business methods and have a higher degree of digitization throughout their operations. There are significant differences in statistical variables among trading companies in Serbia. For instance, business income ranges from 37563.00 (LUKOIL Serbia) to 118913.00 (DELHIZE Serbia), net result ranges from 1629.00 (MERCATOR-S) to 4133.00 (LIDL Serbia), business assets range from 8969.00 (LUKOIL Serbia) to 83479.00 (DELHAIZE Serbia), the capital ranges from 0 (MERCATOR-S) to 42756.00 (DELHAIZE Serbia) and the number of employees ranges from 47.00 (OMV Serbia) to 11637.00 (DELHAIZE Serbia). Foreign retail chains have greater financial and non-financial resources at their disposal. Based on the research in this paper, the most important trading companies are DELHAIZE Serbia, LIDL Serbia, MERCATOR-S, NELT CO. and MOL Serbia. These companies primarily dominate and influence the business conditions in the retail market in Serbia.

EVALUACIJA PERFORMANSI TRGOVINSKIH PREDUZEĆA U SRBIJI NA BAZI FF-WASPAS I WASPAS METODA

Rezime:

Glavni cilj ovog istraživačkog rada je sveobuhvatna analiza učinka trgovačkih kompanija u Srbiji i predlaganje odgovarajućih mera za buduće poboljšanje. U konkretnoj studiji slučaja, DELHAIZE Srbija ostvarila je povrat od prodaje od 2,50%, povrat na imovinu od 3,56% i povrat na kapital od 6,95% u 2021. godini. Sa druge strane, LIDL Srbija je ostvarila povrat od prodaje od 5,77%, povrat na imovinu od 6,66% i povrat na kapital od 12,55% iste godine. Prema tome, LIDL Srbija je ostvarila veći uspeh od DELHAIZE Srbija. Uopšteno govoreći, strani maloprodajni lanci pokazuju bolji učinak od domaćih. Jedan od razloga za to je što usvajaju nove poslovne metode i imaju veći stepen digitalizacije celokupnog poslovanja.

Ključne reči: učinak, efikasnost, faktori, FF-WASPAS i WASPAS metoda, trgovina u Srbiji.

JEL klasifikacija:

L66, L81, L91.
